

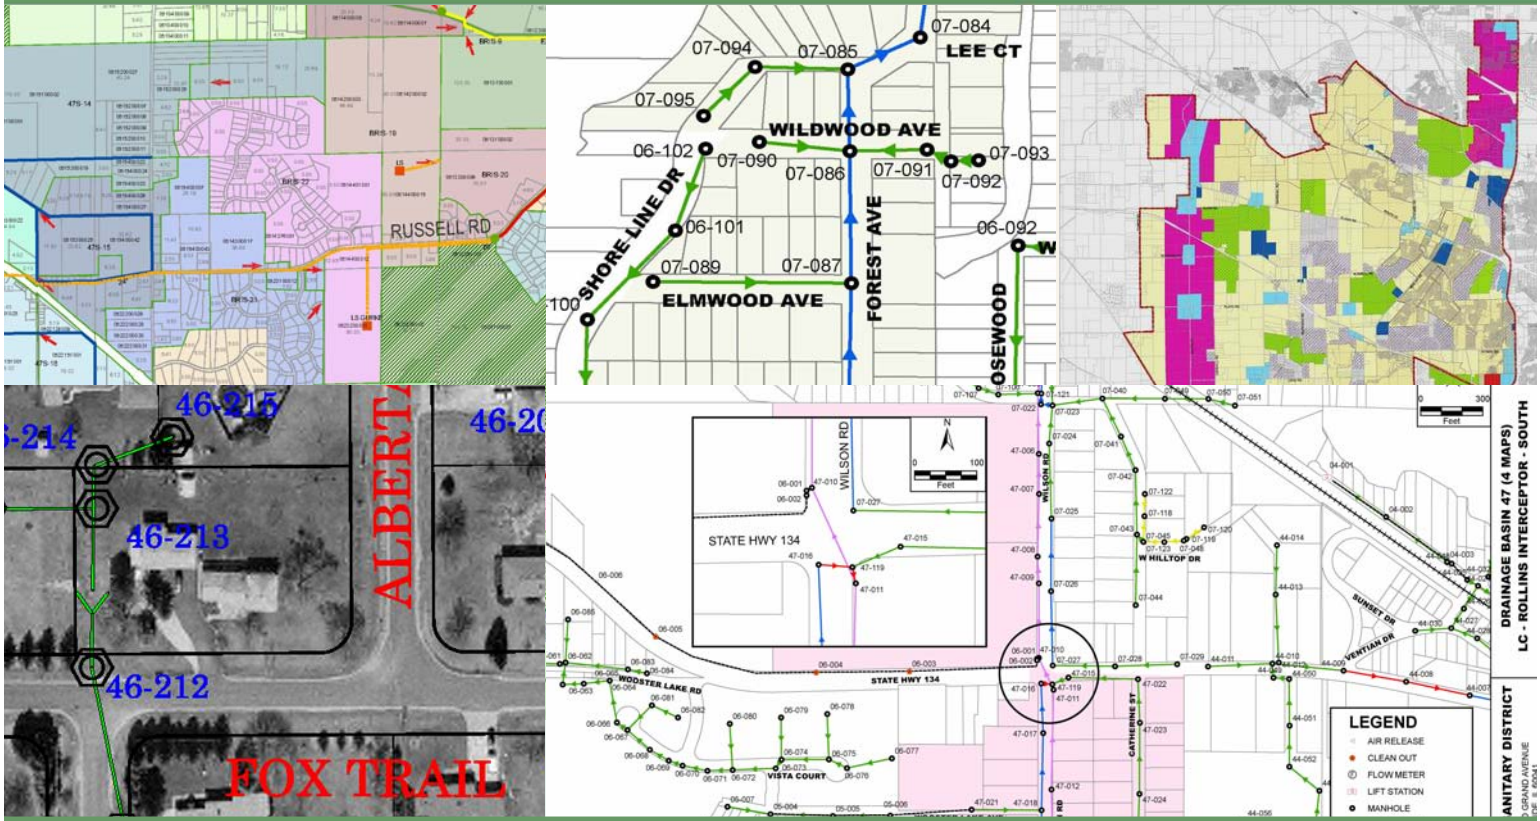

Mapping and GIS

RHMG's mapping and GIS services help our clients manage, store, protect, analyze, and visualize the data for their utilities and infrastructure. Geospatial data management can take the form of Computer Aided Design and Drafting (CADD) mapping, or more sophisticated Geographic Information Systems (GIS), depending on a client's needs and resources. RHMG can also aid in the collection of field data and creation of geodatabases using our global positioning satellite (GPS) technology. As infrastructure ages and funding becomes limited, the need to plan, budget, and protect and maintain assets is becoming increasingly more important. Our goal is to develop geospatial mapping tools and services that support our clients' program operations, policy evaluation, and decision-making. Let RHMG Engineers show you how our mapping services can improve the efficiency of your utility.

PROJECTS

- Aerial Mapping
- Lot and Block Mapping
- Water Distribution
- Sanitary and Storm Sewers
- Gas Distribution
- Electrical Distribution
- Zoning
- Annexations

SERVICES

- GIS (Geographical Information Systems)
- Management of Graphical and Non-Graphical Information
- Incorporate Data with Graphics
- Database Development
- Customize Graphics, Database, and Menus
- System Setup and Training Assistance
- Electronic/Manual Locations
- GPS Horizontal Control
- In Flight GPS
- Analytical Triangulation
- Geodetic Control
